

THE 'ASSURANCE' OF RISK ELIMINATION

WITH MAVERIC'S INFORMATION SECURITY SERVICES

With great progress in technology, internet usage and information exchange, comes greater threats to information assets. Most system vulnerabilities are a result of poor implementation and lack of understanding of the importance of specialized security controls. It is important to identify and address these risks to avoid compromise of sensitive business and customer information.

Our Information Security Services Help Clients:

Application Security Assessment

Web applications control valuable data that are very difficult to secure. Application Security Assessment reveals vulnerabilities and configuration flaws that could lead to unauthorized access,

information loss or denial of service. It checks user identification and authentication, input and output validation controls, and vulnerabilities that exist based on OWASP standards. This is offered by Maveric as a remote service.

Network Security Assessment

Establishing a secure network without performance issues has always been a challenge. Our Network Assessment service helps clients identify network related threats, design mitigation steps and improve security posture. It also involves Network & Servers Performance and Configuration Audit, Protocol Analysis, Vulnerability Assessment and Penetration Testing.

Vulnerability Assessment

Vulnerability Assessment is carried out using automated tools that test for a range of potential weaknesses. Selected VA tools set, scans specific devices within the organization's network and identifies latent vulnerabilities. Scans are executed on desktops, critical servers and security devices on the network.

Penetration Testing

Penetration Testing is done simulating the role of an external threat, using information that is

publicly available. Our ethical hacking team attempts to penetrate the security mechanisms on the perimeter of the network and the mechanisms of access control to the core system. Industry-standard and custom-built tools are employed to detect problems with the design, installation and configuration of the target system. Maveric offers Penetration Testing as a remote service.

ISO 27001 Consulting

One of the key ways to ensure that organizations address key issues relating to information security is by compliance to ISO 27001. This helps minimize losses due to possible security breaches. Our team helps clients understand and adopt controls prescribed by the standard, to suit their business needs using a comprehensive and proven methodology.

BCP / DR Consulting

Good Business Continuity Plans (BCP) keep organizations running

through various critical interruptions like power failures, IT system crashes or natural disasters.

We provide consultancy to help clients implement a Business Continuity Plan, based on industry best practice. BS25999 is an internationally recognized and certifiable standard that establishes the process of Business Continuity Management.

PCI-DSS Consulting

The Payment Card Industry (PCI)-Data Security Standard (DSS) was adopted by Maveric to encourage and enhance cardholder data security. We help clients achieve a level of vigilance with regard to compliance against the PCI-DSS requirements. We also facilitate the process of keeping our clients apprised through approved QSA.

THE MAVERIC EDGE

Maveric Systems is a preferred "IT LifeCycle Assurance" partner to leading corporates in the Banking, Insurance and Telecom verticals in UK, Europe, APAC and Middle East. The company's Requirements Assurance, Application Assurance and Program Assurance services are aimed at eliminating quality, cost and time-to-market risks associated with large IT transformation programs.

At the heart of Maveric's value proposition is its 'Assurance-only' business model aided by domain & IP led integrated solutions that cater to diverse assurance requirements from inception to go-live.

Requirements Assurance | Application Assurance | Program Assurance
